JOKAY, I.

The water and salt content of vagus-pneumonic lungs.
L. Kesztyus, L. Kocsár, I. Jókay, and I. Sántal (Med.
Univ., Debrecen). *Acta Physiol. Acad. Sci. Hung.* 8,
237-46 (1955) (in German).—Data from 43 cats establish
that bilateral cervical vagotomy results in typical lung in-
flammation in which the H_2O , Na, and Cl content of the lung
increase considerably while the K decreases and the Ca re-
mains constant. Normal H_2O , Na, and Cl levels are again
attained by serous infiltration and edema. When severing
the vagus results only in stasis, the water and salt content
of the lung is nearer normal value. In both cases the Ca
concn. in the blood serum is not significantly altered while
the NaCl concn. is reduced. Henry B. Hastin.

Phosphorylase prepared from the heart muscle of the cock was used for immunization of the rabbit. The antibodies so obtained were used in the experiments. The antibodies precipitated and inhibited the muscle phosphorylase-a and -b of the cock but also of the pigeon and of the duck, but not the muscle phosphorylases of the mammals. There was only a small inhibition of cock heart muscle phosphorylase and no inhibition of liver phosphorylase and muscle mutase. The inhibition was not caused by competition.

"Differentiation of Myosins Extracted From Tonic and Tetanic Muscles Based on Their Antigenic Properties."

Budapest, Kiserletes Orvostudomány, Vol XIV, No 6, 1962, pp 593-599.

Abstract: [Authors' summary] Based on immunological determinations, the authors concluded that

1. myosin is a class-specific antigen,
2. the myosin which exhibits a relatively high cholinesterase and a low adenosinetriphosphatase activity and is obtained from tonic muscles had a structure different from that of the myosin obtained from tetanic muscles.

"Quantitative Precipitation and Enzyme Inhibition by Antiphosphorylase."

Budapest, Acta Microbiologica Academiae Scientiarum Hungaricae, Vol X, No 2, 1963, pages 163-173.

Abstract: [English article, author's English summary modified] The quantitative precipitation and enzyme inhibition by homologous antisera, prepared against crystalline rabbit muscle phosphorylase b, have been analyzed. It has been shown that, when the relative inhibition is under 66 per cent, the inhibiting effect of the sera is proportional to the antibody content. The inhibiting action of the sera was expressed in antiphosphorylase units. As compared to the amount neutralized at the equivalence point, in case of excess antigen the same amount of antiserum was able to inhibit the activity of a two-fold amount of phosphorylase. The correlation between enzyme inhibition and the precipitating antibody content of the sera was approximate only. The causes of this phenomenon are discussed. 1 Hungarian, 8 Western references.

SOURCE: Kiserletes orvostudomány, v. 17, no. 6, 1965, 666-667

TOPIC TAGS: hematology, histology, blood circulation, hemoglobin

ABSTRACT: A method is reported for the estimation of the blood content of organs on the basis of the known method of blood oxyhemoglobin determination. By means of this, we can determine more accurately in the various organs and tissues the amount of those components which are present, in another concentration, in the blood. Title : The Conditions For An Electrophoretic Separation
of Alkaloids.

Orig Pub: Geskosl. farmac., 1957, 6, No 8, 432-436.

Abstract: The electrophoretic mobility of weak acids and bases is considered from a standpoint of the Broenstadt's theory. It is shown that the acids have a greater μ than the bases, that μ depends on pH and to a lesser degree on the ionic strength of the buffer solution. The experimentally found curves for pilocarpine, quinine, paraverine, codeine, morphine, strychnine, brucine, cocaine and atropine agree well with

Isomeric Xylols by a Gas-Liquid Chromatography
Method.

Orig Pub: Chem. listy, 1958, 52, No 2, 276-282.

Abstract: A device is described which enables one to deter-
mine quantitatively such mixtures which cannot be
separated into all components chromatographically.
The separation can be accomplished by the above
device by combining gas-liquid chromatography with
UV spectrophotometry. Individual fractions leaving
the chromatograph with a carrier gas enter a sil-
ver coated glass cell equipped with quartz windows

The greater the physical strain, the greater the sensitivity to temperature changes, even if the insulating properties of the clothes remain constant. Every drop of temperature at temperatures over zero requires a greater increase of the insulating properties of clothes than at temperatures below zero. That means that the danger of chilling is much greater when the drop of temperature occurs at higher temperatures than when it happens at lower temperatures.

"Working Garments for Agriculture."

Prague, Pracovni Lekarstvi, Vol 15, No 7, 1963, pp 286-291

Abstract: The authors suggest that the garments supplied for agricultural employees be designed according to the following basic requirements. The cut should allow all the freedom in every variety of activity; it should be safe for work with all the machines with which the worker will perform his duties; the material of the garment should conform to the needs of hygiene, such as easy dust removal. The authors selected the materials labelled "farmers cord", "working cord" and "many-colored cord" of the National Enterprise Vigona as most suitable. These garments may be adapted for winter use by warm linings that can be buttoned on the inside. 7 Figures, 3 Tables, 3 Western, 2 Czech, 6 Russian references.

AUTHOR: Jokl, M. (Engineer, Candidate of sciences) (Prague)

TITLE: Determination of thermal loads on the human body surface

SOURCE: Vynalez, no. 8, 1965, p. 20 of supplement

TOPIC TAGS: IR analysis, human physiology

ABSTRACT: A method is described for the determination of thermal loads on individual parts of the surface of the human body by infrared radiation. This method is based on the principle that the thermal flow is constant within the scope of a solid angle, and is characterized by the fact that the space occupied by the individual is divided into solid angles originating in the same pole. An opaque spherical surface of given diameter is placed at the pole, and thermal sensors measure the temperature of the individual parts of a spherical surface bounded by the solid angles. The course of the effective temperatures of heat radiation is calculated by applying thermal balance equations to these parts.

TITLE: Influence of the permeability of clothing on human thermal comfort ^{AND} work output

SOURCE: Textil, no. 11, 1965, 432-434

TOPIC TAGS: ~~clothing, clothing permeability, ventilated clothing~~, body temperature,
SPECIAL PURPOSE CLOTHING, INDUSTRIAL HYGIENE

ABSTRACT: The need for well-ventilated clothing to permit body perspiration to function as a coolant is presented. Using tables and formulas, the author concludes that to achieve optimum work output, men need to wear well-ventilated clothing. Nonpermeability of clothing can be compensated for by a) increasing the speed of air current, b) reducing steam in the air, and c) lowering the heat-insulating capacity of clothing. If work clothing is not well ventilated — and ventilation decreases with soil — the resistance transmitted is indefinite and the evaporation heat is zero. "Evaluation of the Human Heat Load."

Prague, Pracovni Lekarstvi, Vol 18, No 2, March 66, pp 49 - 53

Abstract [Authors' English summary modified]: A new method of evaluating heat stress is described. Four criteria for the load are used: total heat load, total hyper- or hypo- thermic load, irregularity, and change in the heat load. On the basis of these factors effective work time during a definite period can be determined, the work load under adverse heat conditions evaluated, and the allowable irregularities and changes in the heat load permissible during working activities specified. The total heat load may be calculated on the basis of the total sweat excretion. The change in the temperatures at the beginning, at the end, and changes during the working span are evaluated. 9 Figures, 7 Western, 8 Czech, 1 Russian reference. (Manuscript received 16 Jan 65).

TITLE: Temperatures at the production stations in metallurgical plants and their evaluation

SOURCE: Hutnicka listy, no. 2, 1966, 77-83

TOPIC TAGS: metallurgic industry, industrial condition

ABSTRACT: Various methods used at present for the evaluation of temperature conditions in the locations where the operators must work are discussed. Among the methods described P4SR index, heat stress index, and Giovanni's index are evaluated. Better means of the evaluation of the working conditions are suggested. 270 locations in various plants in Czechoslovakia were investigated. Results of this investigation were used to prepare standards for protection against radiant heat. Orig. art. has: 7 figures and 1 table. [Based on authors' Eng. abstract] [JPRS: 34,779]

"Cosmonauts and the Microclimate of the Space Ship."

Prague, Radar, Vol , No 4, Dec 66, pp 44 - 49

Abstract: The important factors in the conditions on board a space ship are: the supply of an adequate amount of oxygen; limitation of the amounts of CO₂ and water; maintaining adequate temperature and pressure limits; control of odors. The apparatus used for these purposes must have a limited weight and function automatically. It must use as little energy as possible and be fireproof and reliable. In the USSR space ships VOSTOK the limits are: CO₂ 1%, O₂ 21-46%, relative humidity 30-70%. Practically 0.25-0.44, 24 - 27, and 53 to 69% were maintained during manned flights. The cabin pressure was maintained at 755 torr at the beginning and dropped to 740 at the end of the flights. Limits of substances causing odors are given. Apparatus used for the maintaining of the atmosphere in the VOSTOK is described. 8 Figures, 1 Table, no references.

1/1

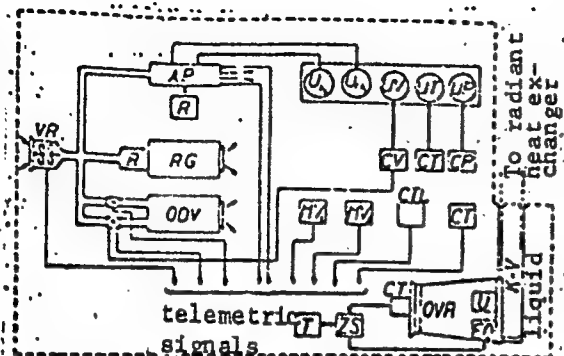

ACC NR: AP7005120

1% ($pCO_2 = 8$ mm Hg). In Vostok-2, CO_2 concentration varied from 0.25—0.44%. Acceptable relative humidity by Soviet standards is 30—70%. In Vostok-1 humidity ranged from 62% at the beginning to 69% at the end. In Vostok-2, humidity varied between 53 and 54%. Soviet standards for permissible air contaminants (in parts per million) are: acrolein - 1.8, ammonia - 50.0, amylacetate - 1.0, chlorine - 3.5, organic sulfides - 0.005, ozone - 0.05, pyridine - 0.25, H_2S - 0.2, and tetrachlormethane - 70.0. Absorption filters used on the Vostoks are described as shockproof, fireproof, chemically stable in oxygen-rich atmospheres at high temperatures, made of porous synthetics, and covered (i.e., surfaced) with hygroscopic material which crystallizes upon exposure to humidity. They also remove dust. Soviets use one kind of filter to remove CO_2 , CO, and H_2S , and a second type which removes NH_3 , H_2S , and other gases (see Fig. 1). The "regeneration unit" (RG) is a sealed container with "regenerative" material (not specified) and a regulatory mechanism (R). Dust- and odor-catching filters are placed on the "regeneration unit" outlet. Ducts leading from the ventilator fan (VR) to the dehumidifier (ODV) are equipped with louvers, one of which is controlled by the humidity sensor, while the other is operated manually. The outlet from the dehumidifier also contains a dust filter. The automatic gas analyzer (AP) registers percentages of O_2 and CO_2 and transmits this data to indicators (UO_2 and UCO_2) on the cabin instrument panel and to ground stations telemetrically. A warning lights up on the panel if safe limits are exceeded. Cabin air containing CO_2 , water vapor, and contaminants is removed from the cabin by the ventilator fan (VR) and moves to

RG - regenerating unit; R - regulatory mechanism; ODV - dehumidifier with one automatic and two manual gauges; T - thermostat; CT - temperature sensor; CV - humidity sensor; CP - pressure sensor; VR - ventilator fan with electric motor; MV and MV₂ - humidity meters; UV - humidity indicator; AP - automatic gas analyzer; VO₂ - oxygen content indicator; UCO₂ - indicator of carbon dioxide content of cabin; VT - temperature indicator; UP - pressure indicator; ZS - amplifier, OVR - exhaust fan with a diffusor system for regulating air temperature; K-V - air-liquid exchanger; EO - electrical control for air louver; V - air-flow louver.

Card 3/4

ACC NR: AP7005120

the "regenerating unit" (RG) where CO₂, water vapor, and contaminants are absorbed and a certain amount of oxygen is released. The remaining contaminants are caught by exit filters. The desired O₂ concentration is maintained by the regulator (R). When humidity rises above 70%, an automatic mechanism opens louvers which cause air to pass through the dehumidifier (ODV). When humidity in the cabin drops to 35 ± 5%, the louvers to the dehumidifier close automatically. These louvers can also be controlled manually. Temperature in the cabin is controlled by an air-liquid heat exchanger (K-V) with its own temperature sensor (CT), thermostat (T), amplifier (ZS), exhaust fan (OVR), and electrically controlled louvers (EO and U). The air cycle is open while the liquid cycle is closed. A special device catches condensed water. The desired temperature is set manually on the thermostat (T). When cabin temperature deviates from the set temperature, the electrically controlled louvers (EO and U) alter the amount of air to the air-liquid heat exchanger (K-V) which cools the air. Temperature control can be maintained with an accuracy of ±1.5C. Cabin climate-control equipment is turned on four hours before takeoff for checking out. The cabin is sealed one hour before takeoff. Prior to launching the air pressure in Vostok-2 was 750 mm Hg, the temperature was +19C, and the relative humidity was 62%. These values changed insignificantly during flight. , Orig. art. has: 10 figures and 3 tables. [BM]

V 136. Electrophoretic separation of sulphonamides
 A. Okáč and V. Jokl (Inst. of Anal. Chem., Faculty
 of Nat. Sci., Brno, Czechoslovakia) (*Czechoslov.
 Pharm.*, 1958, 4 (4), 218-220).—The electrophoresis
 of a number of commercial sulphonamides was
 carried out on paper strips (10 cm. x 37 cm),
 with an a.n.f. of 120 V. and 11.30% NaOH, and
 various buffer solutions to give electrolytes of pH
 from 1 to 13. The detection (after 2 to 5 hr. of
 constant flow) of the separated sulphonamides was
 carried out with a soln. of 1 per cent. p-dimethyl-
 aminobenzaldehyde in 3 per cent. HCl; as detection
 by diazotisation was not achieved. The mobilities
 obtained are not absolute, and endosmosis of the
 electrolyte towards the cathode at pH > 4.7 must
 also be taken into account. The largest mobility
 differences were found in alkali soln., a borate
 buffer of pH 8.3 being particularly useful for the
 separation.

TITLE : A Reaction for the Identification of Barbiturates

ORIG. PUB. : Ceskoslov Farmac, 7, No 7, 397-398 (1958)

ABSTRACT : The separation and identification of barbiturates and hydantoins is based on the Zwicker reaction. The chromatogram is immersed in a solution of $[Cu(C_2H_3N)_2]^{2+}$ followed by immersion in a dilute solution of the Na_2 -salt of ethylenediaminetetraacetic acid, which suppresses the interfering background. The spots are identified by dipping the chromatograms in a solution of sodium diethyldithiocarbamate. The sensitivity is equal to that of the spot test, i.e., 5 micrograms in the iden-

SOURCE: Chemické zvesti, ¹⁸no. 8, 1964, 584-596

TOPIC TAGS: chelaton, glycine, chelate compound, electrophoresis, solution property

ABSTRACT: The curves of the electrophoretic mobility of glycine complexes were determined by measurements; N,N-bis(hydroxy ethyl)-glycine, imino-di-acetic acid, and N-hydroxy-ethyl imino di-acetic acid, with a number of di- and tri- valent central ions were studied. On this basis the probable structure and approximate constants of the stability of the complexes were determined. Substitution by hydroxy-ethyl group is discussed, and the character of the chelates prepared in this manner is described. Orig. art. has: 4 formulas, 6 graphs, 2 tables.

TITLE: Study of complex compounds in solution by means of paper electrophoresis.
IV. Complexes of 1,3-diaminopropanol (2)-N,N,N',N'-tetraacetic acid

SOURCE: Chemické zvesti, no. 4, 1965, 249-258

TOPIC TAGS: intermolecular complex, coordination chemistry, organic nitrogen
compound, acetic acid, hydroxyl group, electrophoresis, paper chromatography

ABSTRACT: 1,3-Diaminopropanol(2)-tetraacetic acid (DPTA) is found
generally as a six-donor chelate-forming agent, and its complexes
are formed similarly to those of ethylenediaminetetraacetic acid
(EDTA) by first forming mononuclear chelates having a 1:1 metal
to agent ratio: the alcohol group of DPTA does not take part in
the chelate formation. The Pb chelate Pb_2A^{4-} is stable at $pH > 4$;
during its formation a proton of the hydroxyl group is released
and DPTA behaves as a 7-donor agent. FeA^{3-} also probably releases
a hydroxyl group above $pH 4$. Chelates of DPTA are less stable
than those of EDTA: Mg chelate is very unstable. The authors thank Prof.-
Engr. S. Stankoviansky for the encouraging discussions concerning this work. Orig.
art. has: 2 figures, 5 formulas, and 2 tables. /JPRS/
